

Value of environmental crime up 26%

According to a report published recently by the United Nations Environment Programme (UNEP) and INTERPOL, the value of environmental crime is 26% larger than previous estimates, at \$91-258bn today compared to \$70-213bn in 2014.

[The Rise of Environmental Crime](#) finds that weak laws and poorly funded security forces are enabling international criminal networks and armed rebels to profit from a trade that fuels conflicts, devastates ecosystems and is threatening species with extinction.

UNEP executive director Achim Steiner said, “Interpol and UNEP have joined forces to bring to the attention of the world the sheer scale of environmental crime. The vast sums of money generated from these crimes keep sophisticated international criminal gangs in business, and fuel insecurity around the world.

“The result is not only devastating to the environment and local economies, but to all those who are menaced by these criminal enterprises. The world needs to come together now to take strong national and international action to bring environmental crime to an end.”

Dwarfs the illegal trade in small arms

Environmental crime dwarfs the illegal trade in small arms, which is valued at about \$3bn. It is the world’s fourth-largest criminal enterprise after drug smuggling, counterfeiting and human trafficking. The amount of money lost due to environmental crime is 10,000 times greater than the amount of money spent by international agencies on combatting it – just \$20-30m.

INTERPOL secretary general Jürgen Stock said, “Environmental crime is growing at an alarming pace. The complexity of this type of criminality requires a multi-sector response underpinned by collaboration across borders. Through its global policing capabilities, INTERPOL is resolutely committed to working with its member countries to combat the organised crime networks active in environmental crime.”

The report recommends strong action, legislation and sanctions at the national and international level, including measures targeted at disrupting overseas tax havens; an increase in financial support commensurate with the serious threat that environmental crime poses to sustainable development; and economic incentives and alternative livelihoods for those at the bottom of the environmental crime chain.

The last decade has seen environmental crime rise by at least 5-7% per year. This means that environmental crime – which includes the illegal trade in wildlife, corporate crime in the forestry sector, the illegal exploitation and sale of gold and other minerals, illegal fisheries, the trafficking of hazardous waste and carbon credit fraud – is growing two to three times faster than global GDP.

Wild For Life campaign

To combat the illegal trade in wildlife, the United Nations system and partners have launched their Wild For Life campaign, which draws on support from celebrities such as Gisele Bündchen, Yaya Touré and Neymar Jr. to mobilise millions to take action against poaching and the trafficking of illegal wildlife products.

Already, thousands of people and more than 25 ministers have chosen a species to show their commitment to protecting wildlife. The host of this year’s World Environment Day, the Government of Angola, has joined the fight, promising to shut down its domestic trade in illegal ivory, toughen border controls and restore its elephant population through conservation measures.

More than one quarter of the world’s elephant population has been killed in a decade. Some of world’s most vulnerable wildlife, like rhinos and elephants, are being killed at a rate that has grown by more than 25% every year in the last decade.

The report also looks at how money generated from the illegal exploitation of natural resources funds rebel groups, terrorist networks and international criminal cartels. In the last decade, for example, poachers have killed an average of 3,000 elephants per year in Tanzania. That’s an annual street market value for ivory traffickers of \$10.5m, an amount that is five times greater than the entire national budget of the country’s wildlife division.

Organised criminal cartels

The report notes that transnational organised criminal networks are using environmental crime to launder drug money. Illegal gold mining in Colombia, for example, is now considered one of the easiest ways to launder money from the country’s drug trade.

International criminal cartels are also involved in the trafficking of hazardous waste and chemicals, often mislabelling this type of waste in order to evade law enforcement agencies. In 2013, the UN Office on Drugs and Crime (UNODC) reported that the illegal trade in e-waste to Southeast Asia and the Pacific was estimated at \$3.75bn annually.

Rebel groups

Criminal networks linked to the conflict in eastern Democratic Republic of the Congo (DRC) have spent about 2% of their proceeds to fund up to 49 different rebel groups. According to some estimates by the UN, the illegal exploitation of natural

resources in eastern DRC is valued at \$722-862m annually.

Illegal logging

The value of forestry crimes, including corporate crimes and illegal logging, is estimated at \$50-152bn per year.

White collar crime

The report looks at the rise of white collar environmental crime, from the use of shell companies in tax havens to launder money generated from illegal logging to transfer mispricing, hacking and identity theft. Carbon trading is the world's fastest growing commodities market. Carbon credit fraud cases have involved sums of transfers and profits that stretch into the hundreds of millions of dollars.
