

Want to act on climate change but not sure how? Tweaking these 3 parts of your life will make the biggest difference

By [Andreas Chai](#)

10 Sep 2021

Last month's dire report by the Intergovernmental Panel on Climate Change may have left you feeling overwhelmed or unsure what to do next. We often hear about ways everyday people can tackle climate change, but which acts will make the biggest difference?

Many people want to act on climate change at a household level, but where's the best place to start? | Source: [Pexels](#)

Demand response programmes encourage people to reduce energy use during peak times. | Source: [Pexels](#)

The academic literature [tells us](#) three spheres of our lives contribute most to climate change: home energy use, transport and food consumption. Together, these activities comprise about 85% of a household's carbon footprint.

As [one study](#) showed, by adopting readily available practices, households in developed countries can cut their carbon footprint by 25% with little or no reduction in well-being.

Clearly, national governments must set and meet ambitious emissions reduction targets. But [72% of global greenhouse gas emissions](#) are related to household consumption. So, small changes at the household level really can make a world of difference.

Here's a guide to get you on the right path:

1. Home

Using energy in the home more efficiently is a good way to reduce your impact on the climate. Signing up to so-called "demand response" programmes is a relatively new way to do this.

Demand response involves making changes to energy use to reduce stress on the electricity grid during times of high demand. In Australia, this often entails electricity companies offering financial incentives to households so they use less energy at peak times.

For example, in Queensland, the state-owned company Energex [offers up to AUS\\$400](#) to those who install a “PeakSmart” air conditioner. When the electricity system is under stress, the electricity network will remotely switch the air-conditioner into a lower performance mode.

Do middle class South Africans care about the climate crisis?

Energy retailers have also been [trialling](#) demand response programs in other states. For example, under AGL’s Peak Energy Rewards programme, customers can choose to receive an SMS message prompting them to reduce their energy use at peak times. By turning up the temperature on the air conditioning or waiting to do the laundry, people can earn discounts on their energy bills.

Demand response leads to less electricity use and reduces the need for fossil-fuel electricity generation at times of high demand - and so, can cut greenhouse gas emissions in the electricity sector.

2. Transport

If you drive a traditional petrol or diesel vehicle, try to reduce the amount of time your engine [idles](#). Research last year found Australian motorists are likely to idle more than 20% of the time they’re driving. If idling was eliminated from all journeys, the emissions saved would equal that of removing up to 1.6 million cars from the road.

While some idling is unavoidable such as when stopped at traffic lights, drivers can turn their engines off while parked and waiting in their vehicle.

And drive smoothly, not aggressively. Driving with limited acceleration and braking has been [found to](#) significantly reduce emissions.

You might be thinking of making your next car an electric vehicle. While the cost of electric vehicles has traditionally been prohibitive for many people, the technology is [expected to reach](#) price parity with conventional cars in Australia in the next few years. And these days, you can even get a good [second-hand deal](#).

There's a lot of misinformation out there about whether electric cars are a good choice for the planet. So where does the truth lie? It's true that electricity used to charge an electric vehicle's battery is often sourced from fossil fuels. And energy is still required to make an electric vehicle - in particular, the battery.

Ordinary people, extraordinary change: Addressing the climate emergency through 'quiet activism'

Wendy Steele, Diana MacCallum, Donna Houston, Jason Byrne and Jean Hillier 26 Aug 2021

However, last year, [research found](#) in 95% of the world, electric vehicles were less emissions-intensive than traditional cars over their full life cycle – even accounting for the current emissions intensity of electricity generation.

If you buy an electric vehicle, it's important to ensure potential emissions savings are realised. One way of doing this is by recharging during the middle of the day when renewable electricity [is most abundant](#). And don't forget, as renewable energy forms an ever-increasing share of the electricity mix, the climate benefits of electric vehicles become even greater.

And of course, don't forget about the obvious low or zero-emission ways to get around: walking, cycling, catching public transport and car pooling.

3. Food

[Research](#) earlier this year showed food systems are responsible for a third of human-caused greenhouse gas emissions. And [recent studies show](#) even if the world stopped burning fossil fuels immediately, emissions from the global food system could still push global temperatures over the 1.5 degrees Celcius warming threshold.

Reducing meat consumption is a well-known way [to cut your](#) carbon footprint. In fact, [recent research](#) from Sweden showed just how high emissions from meat and dairy products are, compared with substitute products. It found:

- lamb is 25 times more polluting than tofu
- milk is five times as polluting as oat drink
- dairy-based cheese is four times as polluting as vegan cheese.

In Australia, the range of meat alternatives is growing quickly. In just one example, Sydney-based All G Foods is developing plant-based mince, sausages, chicken and bacon, as well as “cow-free” dairy products.

Helped along [by \\$5 million](#) in federal government funding, the company’s first product launches this month.

Another food that promises to help cut your carbon footprint is seaweed. Australia is only just [catching on](#) to the benefits of commercial seaweed production, which can be grown with few environmental costs.

Australia’s first factory manufacturing food-grade seaweed products [opened](#) in New South Wales last year. It has the capacity to put seaweed into pastas, and even muesli!

Reduce, reuse, inspire

Reducing your climate footprint is not just about buying “green” stuff - it’s also about avoiding consumption in the first place. So try to buy less - and if you can’t avoid it, try and buy second-hand.

You never know, you might start a revolution. [Evidence suggests](#) people who observe their peers undertaking environmentally friendly behaviour often adopt similar actions.
